Instruction

Guided Practice 1.2.1

Example 1

James earns \$15 per hour as a teller at a bank. In one week he pays 17% of his earnings in state and federal taxes. His take-home pay for the week is \$460.65. How many hours did James work?

- Read the statement carefully.
 Reread the scenario and make a list of the known quantities.
 James earns \$15 per hour.
 James pays 17% of his earning in taxes.
 His pay for the week is \$460.65.

 3. Read the statement again and look for the unknown or the variable.
 The scenario asks for James's hours for the week. The variable to solve
 - The scenario asks for James's hours for the week. The variable to solve for is hours.
- 4. Create expressions and inequalities from the known quantities and variable(s).

James's pay for the week was \$460.65.

____ = 460.65

He earned \$15 an hour. Let *h* represent hours.

15h

He paid 17% in taxes.

-0.17(15h)

Put this information all together.

15h - 0.17(15h) = 460.65

Example 2

Brianna has saved \$600 to buy a new TV. If the TV she wants costs \$1,800 and she saves \$20 a week, how many years will it take her to buy the TV?

UNIT 1 • RELATIONSHIPS BETWEEN QUANTITIES Lesson 2: Creating Equations and Inequalities in One Variable

4. Create expressions and inequalities from the known quantities and variable(s).

Brianna needs to reach \$1,800.

= 1800

Brianna has saved \$600 so far and has to save more to reach her goal.

600 + ____ = 1800

Brianna is saving \$20 a week for some unknown number of weeks to reach her goal. Let *x* represent the number of weeks.

600 + 20x = 1800

5. Solve the problem for the number of weeks it will take Brianna to reach her goal.

 $\frac{600 + 20x = 1800}{-600}$ $\frac{-600}{20x = 1200}$ $\frac{20x}{20} = \frac{1200}{20}$ x = 60 weeks

Brianna will need 60 weeks to save for her TV.

6. Convert to the appropriate units.

The problem statement asks for the number of years it will take Brianna to save for the TV. There are 52 weeks in a year.

$$\frac{1 \text{ year}}{52 \text{ weeks}}$$

$$60 \text{ weeks} \bullet \frac{1 \text{ year}}{52 \text{ weeks}}$$

$$60 \text{ weeks} \bullet \frac{1 \text{ year}}{52 \text{ weeks}} \approx 1.15 \text{ years}$$
Brianna will need approximately 1.15 years, or a little over a year, to save for her TV.
